

Clinical documentation, built around the evidence.

Clinora helps health professionals structure clinical evidence, verify key information and turn it into clear documentation they review and sign.

LIVE AND EXPLORABLE TODAY

Exercise Physiology → NDIS Exercise Physiology

Healthcare professionals collect the evidence.
Documentation still gets built the hard way.

Clinical work produces measurements, observations, assessments, goals and outcomes. Turning those pieces into clear, consistent documentation is a separate problem.

Clinora sits between the evidence and the finished document.

Evidence first. Documentation second.

Documentation is the output of a chain of evidence, not a blank text box waiting to be filled.

01 Clinical information What the clinician observed, measured and recorded.	02 Structured evidence Held as fields with units, dates and references — not as sentences.	03 Verification Calculations and required fields are checked before any prose exists.
04 Clinical context Measures are linked to the goals and history they speak to.	05 Documentation Drafted from the verified evidence, in the structure the reader expects.	06 Clinician review The clinician reads, edits and signs. Nothing leaves unsigned.

Built around the way different health professionals work.

One platform. Different clinical workflows.

Exercise Physiology

Outcome measures, functional change and goal-linked progress documentation.

The same evidence layer continues beyond the professions listed here.

Exercise Physiology

Clinical documentation built around outcome measures, goals and functional change.

AVAILABLE NOW

NDIS
Progress and review documentation built from verified outcome measures and goals.

COMING SOON

Outcome Measures
A structured library of measures, units and references.

COMING SOON

Progress Reporting
Change over time, calculated from the recorded values.

COMING SOON

Functional Assessment
Capacity and function recorded as evidence, not prose.

COMING SOON

Goal Tracking
Measures linked to the goals they support.

COMING SOON

Clinical Documentation
Drafts assembled from verified fields for clinician review.

NDIS Exercise Physiology is the first workflow open inside Exercise Physiology. It is one subsection of the profession, not the whole of it.

See Clinora in action.

A real clinical documentation workflow, from retest to reviewed report.

- 01

Retest score

6MWT distance recorded at reassessment: 487 m.
- 02

Change calculated

Clinora calculates +75 m and +18.2% from the baseline and current values.
- 03

Published threshold checked

The change is checked against the reference supplied with the measure.
- 04

Goal linked

The measure is linked to the participant goal it speaks to.
- 05

Report drafted

Prose is drafted from the verified fields, with gaps left visible.
- 06

Clinician reviews and signs

The clinician reads, adjusts and signs the final document.

Sample values shown for demonstration.

Thresholds are checked against the reference supplied with a measure; Clinora does not present a threshold as clinically validated until its library has been clinically reviewed.

The evidence doesn't disappear when the prose begins.

Walking endurance improved from baseline to reassessment, supporting progress toward the participant's community mobility goal.

BASELINE 412 m 6MWT · at assessment	CURRENT 487 m 6MWT · at reassessment	CHANGE +75 m calculated · +18.2%	GOAL Community mobility linked to the measure
--	---	---	--

The sentence has provenance.

Built around clinical judgement, not instead of it.

Clinora calculates.	Change is derived from the recorded values.
Clinora checks.	Required fields and references are checked before prose.
Clinora drafts.	A draft is assembled from what has been verified.
The clinician reviews and signs.	The clinician remains responsible for the final document.

The same evidence layer can travel across the clinical workflow.

Labels describe the current state of development, not a released roadmap. Clinora is building a structured layer around clinical evidence that can support more documentation and administrative workflows over time.

HOW CLINORA WORKS

Capture	Bring clinical information into one structured workflow.
Structure	Turn raw observations and measures into usable evidence.
Verify	Check calculations and relevant evidence before prose is created.
Document	Turn verified information into clear clinical documentation.
Review	The clinician remains responsible for the final output.

The numbers are already there.
The clinical judgement is already there.
Clinora connects them.

One documentation layer. Many health professions.

Clinora starts with Exercise Physiology, then expands the same evidence-led approach across the allied health professionals who document clinical progress every day.
